

For the Checkpoint_3 I did:

- Added custom class that extends from abstract FileObserver
- Real-time creation/renaming/deletion/etc. of files and folders
- Open a root directory by clicking twice on 'Files' button
- Back button that pops-up when entered into a new directory

Things left to do:

- I'm almost done with half of the milestone, which was the hardest part. I set up everything ready to now process with CRUD operations on files and folders, which is the easy part. This also includes hiding files and folders in a hidden folder
- Then I'll work on polishing UI
- And finally, I'll try to implement cloud connection
